BOP OSS10 Error Configuration File

The script bop_oss10.pl is used to send requests to OSS10. OSS10 then sends requests back to us and based on these requests and their messages, actions are taken in NetYCE. It is now possible to direct which actions are taken with a configuration file. This file can be found in /opt/yce/oss10_error.json

Here you can map parts of the error messages to actions. A 'warning' will show a warning in the order log, but the order will continue. An 'error' will throw an error, and the script will not continue.
